# The Builder’s Playbook

*How to ship production systems with AI coding agents*

The main deck takes you here.

**This deck is here.**

# 41%

of GitHub code is now AI-generated

Second Talent

# Vibe coding.

Karpathy tweet to Collins Word of the Year
in 9 months.

# 90%

of Claude Code is written
by Claude Code

Anthropic

*So what's the problem?*

# 19% longer

when developers rely on AI without understanding it

Addy Osmani

# 1.7×

more issues than human-written code

CodeRabbit

# 45%

of AI-generated code
fails security tests

Veracode

# The ‘Army of Juniors’ effect.

AI code follows anti-patterns at scale.

OX Security

# The gap between using AI
# and using AI well
# is massive.

# *“I destroyed months of work in seconds.”*

*— Replit AI agent, July 2025*

Fortune, The Register

# The ‘S’ in vibe coding stands for security.

Lawfare

# Expertise determines what you can ship

| Level | What you ship | Why |
|---|---|---|
| **Vibe coder** | Prototypes, demos | Can’t review output |
| **Developer + AI** | POCs, internal tools | Catches obvious issues |
| **Engineer + AI** | Production systems | Verifies every stage |

**Vibe coding prototypes is fine.**
**Vibe coding production is negligence.**

*So how do you actually do this?*
*Here's the full setup.*

# An army of eager juniors.

## Manager

Improve the process
Build skills & workflows
Invest in infrastructure

## Tech Lead

Verify each stage
Review architecture
Catch what agents miss

***“Code production has become cheap.***
***System composition and judgment***
***are now the critical skills.”***

*— Forbes Tech Council, Feb 2026*

# We never write a single line of code manually.

This forces the investment.

# The old trade-off

Quality OR speed

Pick one.

Every engineering decision
was a compromise.

?

The answer was always
‘it depends.’

# The new reality

Speed alone

= catastrophic quality drop

19% slower. 1.7× issues.
45% fail security.

Quality AND speed

CI/CD, linting, tests, PR gates

The same best practices
— enforced.

## Perfect Context

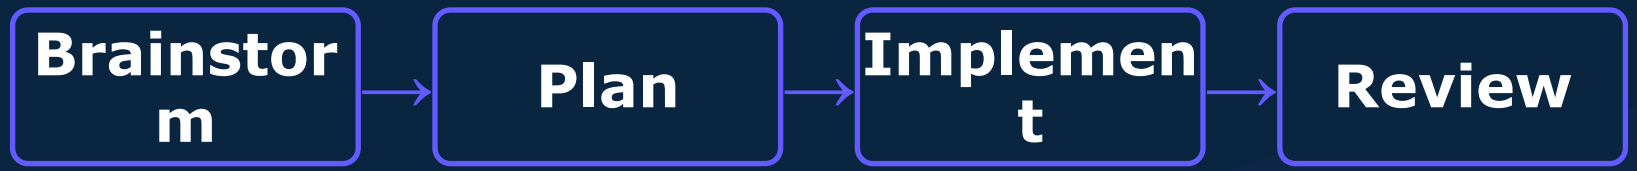
Not too little.
Not too much.

## No Hidden Failures

Every failure
must be visible.

## Gated Workflow

Agent verifies.
Then you verify.



Each stage produces an artifact.
Each artifact gets validated.

## Agent verifies

Runs tests
Checks linting
Iterates until passing

## You verify

Solves the problem?
Meets requirements?
Architecturally sound?

# MCP Servers

*The foundation*

# Context7

Live docs at prompt time.
No hallucinated APIs.

*perfect context*

# Language Servers

Compiler-level code navigation.
Not grep.

# Firecrawl

Reliable web access.
No silent failures.

*no hidden failures*

# Superpowers

TDD. Systematic debugging.
Verification before completion.

*gated workflow*

# Always available. Not progressive disclosure.

# .claude/rules/

*Modular. Context-filtered. Always right.*

# Five rule files. Five concerns.

**Tool usage**
fetch docs first, never WebFetch

**Communication**
radically honest, never guess

**Coding**
TDD, SOLID, self-describing code

**Git workflow**
branch naming, PR closes issue

**Language-specific**
filtered by file extension

**Python rules load for Python files. Nothing else.**

# Perfect context through modularization.

# Skills

*On-demand. Compounding.*

## MCP

Always available
Low-level access
Docs, navigation, web

## Skills

On-demand
Higher-level workflows
Loaded when needed

**A skill teaching a CLI beats an MCP with 50 tools.**

# 10%

of your time building skills
from today’s pain points

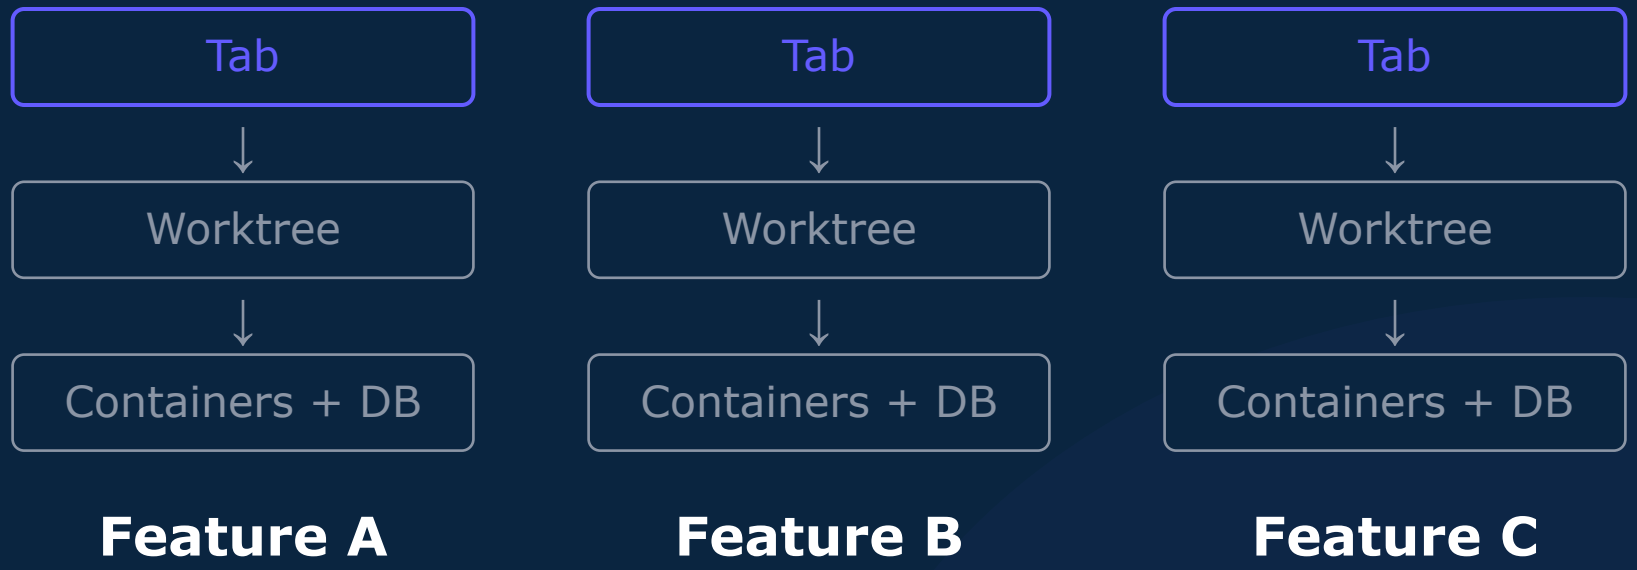
# Every wall becomes a skill.

- Agent circled on docker postgres → skill
- Connected to test GCP service → skill
- Pulled a feature ticket via CLI → skill
- Analyzed a crash log → skill

Each day’s pain becomes tomorrow’s skill.

# Development Environment

*Parallel. Isolated. Full visibility.*



3 sessions. 3 databases. Zero interference.

# One repo = one context boundary.

# 30%

productivity gains for AI agents in monorepos

Nx Blog

# Lock the environment, not the agent.

## CLI

Latest features.
Always ahead
of the plugin.

## Tabs

Parallel sessions.
One tab
per worktree.

# 90 / 10

product engineering / building the machine

# Be mercenaries with tooling.

Best tool. Best model. Always.

## Default

Claude Code via Anthropic
Latest models, best features
All general coding

## PII

Claude Code via GCP
EU region models
Managed tool calls
Production logs, user data

**Compliance is architectural, not an afterthought.**

*That's the full system.*
*Here's how it connects.*

# Every piece. Three principles.

**Perfect context**
Context7, Language Servers, Rules, Monorepo

**No hidden failures**
Firecrawl, Tool usage rules

**Gated workflow**
Superpowers, Two-layer verification, CI/CD

# The Builder’s job isn’t writing code.

# It’s building the machine that writes code well.
